

Membrane processing: a compact survey

The preparation path is deliberately separate from the survey. A boxed value is an illustration, not an observed yield. Methods A3 and B3 appear in the prose as cross-references only. Reading rows by global text order would mix these statements with labels inside the chart.

Illustrative recovery: 999 h. This paragraph wraps beside the flowchart. It does not define a measurement, a footnote or a table row.

Figure 1. Screening flow, not Table 1 data.

Table cells are reported verbatim. Blank Family cells inherit the preceding Family, including across page breaks. A double quote repeats the preceding cell in that column. A row marked (cont.) continues the same row; it is not a new experiment. Footnote letters belong only to the marked cell.

Table 1. Membrane recovery survey

Row	Family	Process	Dry state Yield (%)	Wet state Yield (%)	Recovery (h)	Method
A1	Ceramic	cold cast	92.5	81.0	6	gravity drain
A2		hot cast	93.2	82.4	8	centrifugal recovery
A3		plasma-assisted	91.0	79.5 ^a	12-	vacuum filtration

Table 1 continues on the next page; the last row is unfinished.
Synthetic data. Layout fixture; no scientific findings are claimed.

Recovery survey / continuation

A row continues across this landscape sheet. Repeated headers are navigation, not observations. Diagram values on page 1 are not table data.

Table 1 (continued).

Row	Family	Process	Dry state Yield (%)	Wet state Yield (%)	Recovery (h)	Method
A3 (cont.)		sintering			18	under nitrogen
A4	Polymer	solvent exchange	88.1	76.2	4	sealed chamber
A5		"	87.4	75.8	5	sealed chamber ^a

a For Table 1 only: a 24 h soak precedes the marked measurement or method.

The discussion mentions A6 and a hypothetical dry yield of 100.0%. This is a sensitivity example; the measured A6 row appears on page 3.

Recovery survey / final fragment

Table 1 (continued).

Row	Family	Process	Dry state Yield (%)	Wet state Yield (%)	Recovery (h)	Method
A6		freeze casting	89.0	77.1	7	vacuum drain
A7	Composite	hybrid anneal	94.1	83.7	10 ^b	pressure filtration

b For Table 1 only: recovery includes a 2 h cool-down.

This physical page has a PDF rotation entry. The table is complete and readable after rotating the view. Orientation is not an instruction to exchange the Dry and Wet columns.

Table 2 has its own units and footnote namespace. Reusing the letter a there does not reuse Table 1 note a. Cross-references are not continuation rows.

Rapid cycles / an independent survey

Recovery durations in Table 2 are minutes, not hours. The annotation rules from page 1 still apply. A row can continue on another sheet while its numeric cells remain on this one. Preserve a printed dash as a missing value, distinct from the numeric value zero.

Table 2. Rapid-cycle survey

Row	Family	Process	Dry state Yield (%)	Wet state Yield (%)	Recovery (min)	Method
B1	Foam	ambient rinse	71.0	60.4	0	open tray
B2		heated rinse	73.6 ^a	62.8	15	covered tray
B3		pulse	-	64.2	20-	alternating pressure

Figure 2. Method selection legend

The boxes explain a procedure, not new table rows. Table 2 continues on page 5. Its note a applies only where printed. The dash in B3 is a reported missing value; do not fill it using the diagram.

Rapid cycles / continued

Table 2 (continued).

Row	Family	Process	Dry state Yield (%)	Wet state Yield (%)	Recovery (min)	Method
B3 (cont.)		rinse			25	with a dry purge
B4	Fiber	spin rinse	74.0	63.4	30	sealed vial ^b
B5		"	75.1 ^a	64.9	35	sealed vial

a For Table 2 only: the dry yield uses mass after vacuum drying.
b For Table 2 only: the vial is weighed before opening.

End of both survey tables. Footnotes are local to the table number.
